The chir gene encodes the human mitotic checkpoint protein Chfr (see AAB20219), which is required for regulation of the transition of cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to mitotic stress. A set of primers (see AAF30353-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines SM480, DLD1, HT29, HCT116, SAOS2, UZOS, IMES and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of UZOS cells. Chfr polypeptides and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more sensitive to additional antitumour therapies

Expression of ILIR, in cells and tissues can be modulated by compositions comprising oligomers which are able to specifically hybridise with target areas of its encoding sequence. The composition cape used for treatment of disease in humans caused by excessive receptor expression, e.g. inflammation. When labelled they can be used diagnostically to determine overexpression of ILIR, also to determine localisation and distribution of this expression for research, diagnostically to determine overexpression for research, diagnostically the diagnostical procession of this expression for research, diagnostically the diagnostical procession of the procession for research, diagnostically the diagnostical procession for research, diagnostical procession for research procession for res

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                            Ribozyme which modulates plant gene expression of DELTA-9 desaturase or maize or canola.
                                                                                                                                                                                                                                                                                                                           granule bound starch synthase; hammerhead ribozyme; hairpin modulation; gene expression; transgenic plant; cleavage; carfeine synthesis; coffee plant; nicotine production; tobac
                                                                                                                                                       (RIBO-)

```

The present invention describes an enzymatic nucleic

acid molecule

 Ξ

Claim 40;

93; 155pp;

English.

```
The invention discloses a microarray comprising a plurality of nucleic cald probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of fat least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acids to at least two or more nucleic acids to at least one or more nucleic acids to at least or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 5

Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (CBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New array of nucleic acid probes, useful for Southern, Northern or dot-blot hybridization sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; SEQ ID NO 37841;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                   The invention comprises a method for detecting the presence of alleles of the glutathione S-transferase (GST) genes GSTM1, GSTM3, GSTP1 and GSTT1. The method of the invention involves the geoffically claimed GST allele-specific PCR primers. Cancer research has shown that the presence of various GST polymorphisms correlates with altered risk for certain cancers and altered response and toxicity from currently used cancer treatments (e.g. chemotherapy). The method of the invention is useful for identifying the alleles of GST present in a sample of genetic material and characterising the genetic makeup of a subject. The present DNA sequence represents the GSTT1 allele-specific PCR primer (T1R)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          blot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5 termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                     Claim 29; Page 5; 37pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                            This invention relates to a human purine receptor polypeptide (a P2Y receptor), termed TG20022 selected from a 331 amino acid sequence, given in the specification. The receptor of the invention is a novel G-protein coupled receptor, involved in signal transduction in many different pathways. The polypeptide is useful for screening or identifying a ligand, agonist or antagonist of the receptor of the invention, or for detecting the function or activity of the polypeptide. The polypeptide is useful as a therapeutic agent. The present sequence is that of a PCR primer which was used for amplification of a region of the human TG20022 gene during the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   purine receptor; TG20022; novel G-protein coupled receptor; signal transduction; human; P2Y receptor; PCR; primer; ss.

The present invention relates to nucleic acid molecules which modulate CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC DNA. The nucleic acids may be used to modulate the expression and/or replication of HCV. The compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents substrate for one of the HCV converge.
                                                                                Matches
                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Blatt L, ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   08-JUN-2001;

The present invention relates to nucleic acid molecules which modulate CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense include antisense since the synthesis, actives the such as hammerhead ribozymes, DNAzymes, C inozymes, zinzymes, and G-cleaver ribozymes. DNAzymes, c inozymes, zinzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene capression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV invention or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ACD57028/c

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV
                                                                                                                                                                                                                                                                                                                                                                                                                                           Blatt I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   tumour suppression; tumour reversion; apoptosis; virus resistance; cytostatic; virucide; neuroprotective; nootropic; neuroleptic; probe; primer; PCR; gene chip; antisense; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ds; hu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid, useful with tumors and cell degeneration, and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human tumour

                                                                                                  The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                        Sequence
                                                                                                                                                                             Claim 1; SEQ ID NO 4437; 198pp; English
                                                                                                                                                                                                Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infection especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                      WPI;

                                                                                                                                                                                                                                                                                       The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate

            This invention relates to a novel nucleic acid fragment for hybridising target nucleic acid which contains a first target sequence and a second target sequence, which comprises a sequence complementary to the first
                                                                                                                                                                     Novel nucleic acid fragment comprising sequence complementary to first target sequence, second target sequence and spacer, useful as nucleic acid probe for detecting target nucleic acid and as primer for extending target nucleic acid and as primer for extending target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises a method for detecting a specific DNA sequence, such as a specific DNA sequence from Hepatltis C virus. The method of t invention is useful for detecting Hepatltis C virus and for amplifying DNA sequence from Hepatltis C virus. The present DNA sequence represent DNA sequenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acid fragment comprising sequence complementary and second target sequence and arbitrary sequences, useful as detecting hepatitis-C virus or for hybridizing target nucleic

                                                                            The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the HCV coding region-derived conserved RNA sequence of the invention.
                                                                                                                                                                                                                                                                 New double stranded RNA oligonucleotide, useful for preparing composition for treating or preventing hepatitis {\tt C} virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention is useful as a reagent such as a nucleic acid probe for detecting target nucleic acid or as a primer for extending target nucleic acid. In particular, the invention is useful for detecting human hepatitis-C virus. The invention enables a highly sensitive and specific detection of a target nucleic acid, as a probe, and efficient extension of target nucleic acid, as a primer. The present sequence is that of an oligonuclectide probe which was used for detection of a region of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-FEB-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO2003016572-A1

                                                                                                                                                                                                                                                                           The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the HCV coding region-derived conserved RNA sequence of the invention.
                                                                                                                                                                                                                           Sequence 19 BP; 4 A; 5 C; 7 G; 0 T; 3 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New double stranded RNA oligonucleotide, useful for preparing composition for treating or preventing hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zhao
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17-AUG-2001; 2001US-0313076P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the HCV coding region-derived conserved

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HCV infection; replication; pathogenesis; virucide; vaccine; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribbnucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the HCV coding region-derived conserved RNA sequence of the invention.

                                                         The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the HCV coding region-derived conserved RNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) trarget RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the HCV coding region-derived conserved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New double stranded RNA oligonucleotide, composition for treating or preventing h

                       ASS, and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with virucide, antiinflammatory, hepatotropic or cyrostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The slNA can be directed to conserved regions of HCV genes, so are active against many different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        20-FEB-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
    This invention relates to novel double-stranded short interfering nucleic cacids (siNA) that inhibits replication of hepatitis C virus (HCV), where one strand (ASS) that is complementary to (part of) an HCV RNA (portion) and a sense strand (ASS) that is complementary to ASS, and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with virucide, antiinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit creplication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure, hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target clading gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, consequenced reading affainty. The siNA can be directed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SXS
This invention relates to novel double-stranded short interfering nucleic cacids (siNA) that inhibits replication of hepatitis C virus (HCV), where cone strand is an antisense strand (ASS) that is complementary to (part CC) an HCV RNA (portion) and a sense strand (SS) that is complementary to ASS, and where most of the pyrimidine nucleotides comprise a sugar compdification. The invention may allow development of compounds with convicte, antinflammatory, hepatotropic or cytostatic activities by compound inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA s of the invention may be used to inhibit consequences (liver failure; hepatocellular cancer confidentification and its consequences (liver failure; hepatocellular cancer conditions), and also for drug screening, diagnosis, target conditions of the function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

acids (siNA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antisense strand (ASS) that is complementary to (part of) an HCV RNA (portion) and a sense strand (SS) that is complementary to (part of) and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with virucide, antiinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure; hepatoccellular cancer and cirrhosis), and also for drug screening, diagnosis, target

This invention relates to novel double-stranded short interfering nucleic acids (siNA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antisense strand (ASS) that is complementary to (part of) an HCV RNA (portion) and a sense strand (SS) that is complementary to ASS, and where most of the pyrinidine nucleotides comprise a sugar modification. The invention may allow development of compounds with virucide, antiinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure; hepatocellular cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       20-FEB-2002;

               This invention relates to novel double-stranded short interfering nucleic acids (siNA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antisense strand (ASS) that is complementary to (part of) an HCV RNA (portion) and a sense strand (SS) that is complementary to ASS, and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with virucide, antiinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA modulation (inhibition)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and cirrhosis), and also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The siNA can be directed to conserved regions of HCV genes, so are active against many different
                                                                                                                                                                                                                                                                                                                  New double-stranded short modified pyrimidine bases
                                                                                                                                                                                                                                              Example 3;

ASS, and where most of the pyrimidine nucleotides comprise a su modification. The invention may allow development of compounds virucide, antiinflammatory, hepatotropic or cytostatic activiti

sugar

This invention relates to novel double-stranded short interfering nucleic acids (siNA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antisense strand (ASS) that is complementary to of part of an HCV RNA (portion) and a sense strand (SS) that is complementary to

New double-stranded modified pyrimidine

 This invention relates to novel double-stranded short interfering nucleic acids (siNA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antisense strand (ASS) that is complementary to (part of) an HCV RNA (portion) and a sense strand (SS) that is complementary to ASS, and where most of the pyrimidine nucleotides comprise a sugar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The siNA can be directed to conserved regions of HCV genes, so are active against many different
                                                                                                                                                                New double-stranded modified pyrimidine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatitis C virus short interfering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADF52007

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         virucide, antiinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The slNA can be directed to conserved regions of HCV genes, so are active against many different
                                                                             New double-stranded modified pyrimidine
                                                                                                                                       Mcswiggen
                                                                                                                                                                                                                                                                                                                                 28-AUG-2003.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cof) an HCV RNA (portion) and a sense strand (SS) that is complementary to RAS, and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with Virucide, antinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA's of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target identification and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The siNA can be directed to creains

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc acids (siNA) that inhibits replication of hepatitis C virus (HCV), where consistend is an antisense strand (ASS) that is complementary to (part of) an HCV RNA (portion) and a sense strand (SS) that is complementary to ASS, and where most of the pyrinidine nucleotides comprise a sugar completion. The invention may allow development of compounds with virucide, antiinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA crimterference. The siNA's of the invention may be used to inhibit replication and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target (identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The siNA can be directed to conserved regions of HCV genes, so are active against many different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to novel double-stranded short interfering nucleic CC acids (slNA) that inhibits replication of hepatitis C virus (HCV), where CC one strand is an antisense strand (ASS) that is complementary to (part CC ASS, and where most of the pyrimiddine nucleotides comprise a sugar modification. The invention may allow development of compounds with CC virucide, antiinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA CC interference. The slNA's of the invention may be used to inhibit CC replication of HCV, in cells, tissue explants or organisms, for treating CC HCV infection and its consequences (liver failure, hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target cancer finction and validation, genetic engineering, pharmacogenomics, to studying gene function and gene mapping (for example of single-nucleotide CC polymorphisms). The chemical modification improves stability, activity, activity, collular uptake and/or binding affinity. The siNA can be directed to conserved regions of HCV genes, so are active against many different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to novel double-stranded short interfering nucleic cacids (siNA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antisense strand (ASS) that is complementary to (part CC of) an HCV RNA (portion) and a sense strand (SS) that is complementary to MASS, and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with CC virucide, antinfilammatory, hepatotropic or cytostatic activities by CC modulation (inhibition) of expression or activity of HCV RNA, by RNA contented to the invention may be used to inhibit CC replication of HCV, in cells, tissue explants or organisms, for treating CC (HCV infection and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target cidentification and validation, genetic engineering, pharmacogenomics, consequence function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, consequences of are active against many different many diff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Loc

```

The invention relates to a method of determining genotype or mutant of target nucleic acid comprising selecting the sequence characteristic of the genotype or mutant, amplifying the nucleic acid containing the characteristic sequence, allowing a probe specific to the genotype or mutant to hybridise the amplified nucleic acid, detecting the nucleic acid hybridised to the probe and analysing the hybridisation pattern.

for determining the

genotype or

mutant

of.

target nucleic

of. 얁

Example;

SEQ ID NO 6;

41pp; Japanese.

This is a novel oligomer comprising 20 covalently linked nucleotides which bind to the 5' Cap region of the interleukin-1 receptor (ILIR) mRNA. Expression of ILIR, in cells and tissues can be modulated by compositions comprising oligomers which are able to specifically hybridise with target areas of its encoding sequence. The composition cape used for treatment of disease in humans caused by excessive receptor expression, e.g. inflammation. When labelled they can be used diagnostically to determine overexpression of ILIR, also to determine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           acid, preferably hepatitis C virus. The method is useful for immobilising an nucleic acid fragment to a solid support. The method is useful for purifying and amplifying desired viral genome, preferably hepatitis B virus. The method is useful for amplifying desired nucleic acid and for discriminating the genotype and mutant of hepatitis B virus. The method is useful in detecting the genotype of patient infected with viral hepatitis, estimating the illness condition of patient, and predicting the treatment for the infection. The method efficiently and simply determines the genotype or mutant of target nucleic acid. The method is simple and rapid for discriminating genotype and mutant of hepatitis B virus at higher rate. The present sequence represents a hepatitis C virus
                                                                                                                                                                                                                                                                           2'-substituted oligonuclectide(s) specific for interleukin-1 retype I - used to modulate expression and detect overexpression
                                                                                                                                                                                                             Example 5;
                                                                                                                                                                                                                                                                                                                                                  WPI; 1998-018646/02

                                                                                              AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                            Sequence
                                                                                                                                                                                                                                                                                Genome sequence of Chlamydia pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                    21-NOV-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides antisense oligonucleotides with phosphorothicate backbones directed at the human E2F transcription factor 3 (E2F-3) coding sequences. These can be used in the therapy of diseases which can be treated by modulating E2F-3 expression and to prevent infection, inflammation and tumour formation

                                                                                                                               The present invention provides the protein and coding sequences of several novel human proteins, designated NOVX. These can be used in the treatment of diseases such as cancers, Hodgkin's disease, Von Hippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia telangiectasia, leukodystrophies, addiction, anxiety, depression, pain, obesity, Crohn's disease, osteoporosis, inflammatory bowel disease, infertility, atherosclerosis, hypertension, scleroderma, haemophilia, diabetes, pancreatitis, autoimmune disease, arthritis, immunodeficiencies, HIV, viral, bacterial or parasitic infections, or graft-versus-host disease. The present sequence is an oligonucleotide used to isolate a coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Shimkets I

The invention relates to a new isolated polypeptide (designated NOVX) CC comprising one of 141 fully defined sequences, their mature forms, a protein comprising one or more conservative substitutions or having at CC least 95% identity to one of the 141 proteins. Also included are a CC composition comprising NOVX (or a NOVX nucleic acid molecule (NA)), a kit comprising the composition of NOVX in one or more containers, an isolated CC nucleic acid molecule encoding a NOVX protein, producing NOVX (comprising CC culturing a cell under conditions that lead to expression of the polypeptide, where the cell comprises a vector comprising NOVX (A), comprising culturing a nagent for use in the treatment of a pathology that is related to aberrant expression or physiological interactions of NOVX, screening for a modulator of activity of or latency or predisposition to a cell comprising the vector, an antibody that immunospecifically binds to preventing a pathology associated with NOVX, treating a pathological cell comprising the vector, an antibody that immunospecifically binds to NOVX, determining the presence or amount of NOVX or the nucleic acid molecule in a sample, and determining the presence of or predisposition to a disease associated with altered levels of expression of MOVX or the nucleic acid compositions of the present invention are useful for the diagnosis and treatment of disorders associated with aberrant expression or activity of the NOVX polypeptide, such as cancer, diabetes, obesity, and endocrine, cell compositions of the present invention are useful for the diagnosis and treatment of disorders associated with aberrant expression or activity of the NOVX polypeptide, such as cancer, diabetes, obesity, and endocrine, cell cancer and predictive medicine. The present sequence is an RTQ (real time quantitative) PCR primer for an mRNA encoding a NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prayaga bo,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated NOVX polypeptide. A therapeutic, CC i.e. the NOVX polypeptide, nucleic acid and antibody, is useful for CC manufacturing a medicament for treating a syndrome associated with a CC human disease, e.g. a NOVX-associated disorder. The NOVX polypeptides can be used as immunogens or as vaccines. The NOVX polypeptide, nucleic acid CC or antibody is useful for diagnosing, treating or preventing a NOVX-associated disorder, e.g. cancer, diabetes, Alzhaimer's disease, arthritis, autoimmune disease, graft-versus-host disease, arthritis, arthritis, autoimmune disease, graft-versus-host disease, arthritis, CC scleroderma, systemic lugus erythematosus, bacterial infections, cystic ciproderma, systemic lugus erythematosus, bacterial infections, cystic ciproderma, systemic lugus erythematosus, bacterial infections, cystic ciprosis, coronary artery disease, stroke, hypertension, myocardial CC infarction, haemophilia, idiopathic thrombocytopenic purpura, CC disease, ulcers, muscular dystrophy, myasthenia gravis, endometriosis, CC osteoporosis, osteoarthritis, liver disease, spliepsy, multiple CC osteoporosis, osteoarthritis, liver disease, spliepsy, multiple CC sclerosis, anxiety, pain, fertility, glomerulonephritis, or polycystic cuseful for determining the presence of or preddisposition to a disease CC associated with altered levels of the NOVX polypeptide or the nucleic acid molecule, or for screening for molecules that inhibit or enhance CC probes, in chromosome mapping, tissue typing, preventive medicine, or CC probes, in chromosome mapping, tissue typing, preventive medicine, or CC prominer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to methods for detecting a cancerous colon cell involving detecting at least one differentially expressed gene such as those given in AALA1595-AALA1611. This is useful for diagnosing colon cancer, in rational drug and therapy design, and for identifying additional genes linked to the development or inhibition of development of colon cancer. Examples of colon cancer which can be detected include adenomatous polyp, colorectal carcinoma, high metastatic potential colon tumours and metastatic colon cancer. The present sequence is a PCR prime.
                                                                 Polynucleotide for detecting single nucleotide polymorphisms existing human gene, contains isolated human gene having specified sequence.
                                                                                                                                                      11-DEC-2001; 2001JP-00377637

                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

The sequence information for ca. 230 buch portain microsatellites is summarised in the specification and indexed herein (see below). For each such microsatellite sequence sufficient information was obtd. to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34440. (Updated on 25-MAR-2003 to correct PN field.)

One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information for ca. 230 such bovine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphic bovine DNA markers - used in mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of many molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New array of nucleic acid probes, useful for Southern, Northern or dot-blot hybridization sequence or specific mutations of any gene.

CC in monitoring gene expression levels by hybridisation to a DNA library.

CC in analysis of genetic variation or in hybridisation to a DNA library.

CC compounds. The nucleic acid probes are specifically designed for analysis compounds the ast one target sequence. The method of analysis comprises comprises are attached to a solid support. The analysis comprises mucleic acid probes and detecting the hybridisation. The nucleic acid crobes are attached to a solid support. The analysis comprises monitoring compression levels, identifying biallelic markers or polymorphisms, cor ramily members of a gene and a cross-species comparises monitoring cor family members of a gene and a cross-species comparises. Each of the nucleic acid crobes is useful in in situ hybridisation, in Southern, Northern or dotolot hybridisation to identify or detect the sequence or specific cutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence contained in the microarray note format directly from USPTO at sequence can also be obtained in electronic format directly contained in electronic format directly contained in the microarray.
Sequence 25 BP; 7 A; 9 C; 4 G; 5 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; SEQ ID NO 86601;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New array of nucleic acid probes, useful for Southern, Northern or dot-blot hybridization sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-MAR-2001; 2001US-0276759P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC perfect match, perfect mismatch, antisense match or antisense mismatch.

CC Also disclosed is a method of gene expression analysis. The array is used

CC in analysis of genetic variation or in hybridisation to a DNA library,

CC in analysis of genetic variation or in hybridisation of taglabelled

CC compounds. The nucleic acid probes are specifically designed for analysis

CC of at least one target sequence. The method of analysis comprises

CC hybridising at least one or more nucleic acids to at least two or more

CC nucleic acid probes and detecting the hybridisation. The nucleic acid

CC probes are attached to a solid support. The analysis comprises monitoring

CC or family members of a gene and a cross-species comparison. Each of the

CC nucleic acids further comprises a tag sequence. The array of nucleic acid

CC probes is useful in in situ hybridisation, in Southern, Northern or dot-

CC mutations of any gene, in mapping the 5' termini of mRNA molecules by

CC primer extensions or in screening cDNA or genomic libraries or subclones

CC for additional subclones containing segments of DNA that have been

CC isolated and previously sequenced. The sequence presented is one of the

CC nucleic acid probes incorporated in the microarray. Note: The sequence

CC data for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral blood mononuclear cells (PBMCs) of patients having the disease as compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample is a whole blood sample (claimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples isolated at different stages of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diagnosing non-blood disease such as solid tumor, involves differential expression profile of specific genes in periph sample of subject with reference expression profile of spec

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              telomerase. The expression of transcripts for telomerase, p21, p53, CBFA1 and BSP were determined using quantitative PCR. Cell populations which co-express CD49c and CD90 express telomerase at the level of approximately 13 transcripts/10 power 6 transcripts of 18S rRNA, and these populations continue to proliferate at a constant rate. Compositions containing the cell populations of the invention are useful in treating humans suffering from a degenerative, traumatic, acute injury, cardiac or neurological condition, e.g., such as spinal cord injury, amyotrophic lateral sclerosis, Parkinson's disease, stroke, traumatic brain injury, Fabry Disease condition, metachromatic dystrophy, adrenal leukodystrophy, Canavan disease, Pelizaeus Merzbacher, Nieman-pick or brain tumour, myocardial infarction or congestive heart failure.
